

CSS ARCHITECTURE AUDIT

Restyle 2026 • System Analysis Report

Executive Summary: The provided CSS stylesheet outlines a comprehensive "Restyle 2026" modernization over a legacy *templatemo* architecture. It centralizes previously scattered inline styles into modular classes and introduces a fresh, motorsport/industrial-inspired design system with robust responsive constraints.

1. Design Variables & Palette

The updated stylesheet leverages modern CSS Custom Properties (`:root`) to manage the global theme, ensuring consistency across the application.

				
Ink #0e1a2b	Navy #15263d	Brand #1b2a41	Accent #e4002b	Card / White #ffffff

- **Backgrounds:** Page background uses `--bg: #f4f6f9` while surface layers use `--card: #ffffff`.
- **Typography:** The base font stack falls back to system sans-serif (`-apple-system, Roboto, etc.`) with a self-hosted "Oswald" webfont for display headings.
- **Shadows:** Depth is achieved using dual-layer RGBA box-shadows (`--shadow` and `--shadow-h` for hover states).

2. Core Layout Strategies

The layout transitions away from rigid pixel-based defaults to a fluid, centralized wrapper approach while maintaining legacy compatibility.

Wrapper & Grid	
---------------------------	--

	The <code>#templatemo_wrapper</code> is capped at <code>1180px</code> width with automatic margins for centering. Components like <code>.macro_grid</code> and <code>.listing_grid</code> utilize CSS Grid for multi-column structures.
Full-Bleed Header/ Footer	A clever combination of <code>box-shadow: 0 0 0 100vmax var(--ink)</code> and <code>clip-path: inset(0 -100vmax)</code> is deployed on <code>#templatemo_header</code> and <code>#templatemo_bottom</code> to achieve edge-to-edge dark bars without triggering horizontal scrollbars.
Sticky Header	The header is set to <code>position: sticky; top: 0;</code> allowing the primary navigation to remain accessible while scrolling.

3. Component Architecture

Key UI elements have been standardized with flat design principles, border-radii, and unified interaction states.

- **Buttons** (`a.more` , `.submit_btn`): Replaced fixed image backgrounds with adaptable CSS pills. Features include `border-radius: 24px` , uppercase text, and slight `transform: translateY(1px)` on active state.
- **Cards** (`.post_box`): Given explicit background colors, subtle borders (`#e3e8ef`), rounded corners (`10px`), and drop shadows to segment content blocks visually.
- **Badges** (`.badge`): Status pills for listings. Colors are mapped dynamically (e.g., Premium uses `#e4002b` , Featured uses `#c8962b`).
- **Forms**: Inputs now share unified sizing, `box-sizing: border-box` padding, and a prominent red-tinted focus ring (`box-shadow: 0 0 0 3px rgba(228,0,43,.12)`) for accessibility.

4. Responsive Breakpoints

The design adapts via progressive media queries rather than mobile-first, accommodating the legacy desktop-centric structure:

@media (max-width: 1000px)

Grids (`.macro_grid` , `.feature_row`) collapse from 3 or 4 columns down to 2 columns to prevent content squishing.

@media (max-width: 860px)

Tablet/Mobile Nav Transition: The main layout collapses the sidebar. The horizontal menu shifts to a fixed, off-canvas right-side drawer structure (`transform: translateX(100%)`).

@media (max-width: 520px)

Mobile Optimization: Deep layout adjustments occur here. Typography is scaled down (e.g., H1s drop to `24px`), multi-column grids collapse to a single column (`1fr`), and tap targets are enlarged for touch interaction.

5. Code Health & Auditing Notes

The file includes extensive inline commentary explaining bug fixes and structural decisions. Notably:

- **Consolidation:** Eliminated dozens of `style="..."` inline attributes scattered in the legacy PHP views by moving them to global utility classes (e.g., `.aow-error-text` , `.tbl_collapse`).
- **Specificity Tuning:** Several rules require `!important` overrides to successfully combat the original, highly-specific *templatemo* CSS and dynamically injected plugin styles (like `piroBox` lightbox scaling constraints).
